

MENTLAZA

HACKED MINDZ

Sri Sairam College Of Engineering,
Bengaluru

Mentlaza is a emotion detecting software that is helpful for people suffering from Alexthymia.

Alexthymia

It is a lifelong disorder, where the person suffering from it, is unable to recognize the emotions of others as well as themselves.

How does it work?

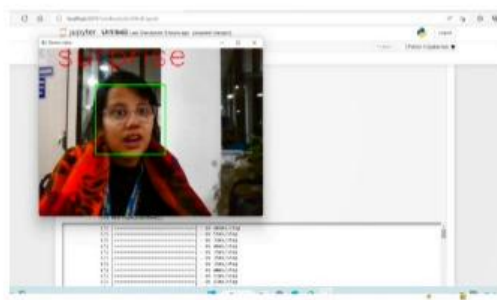

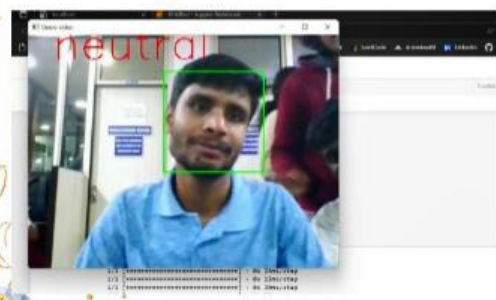

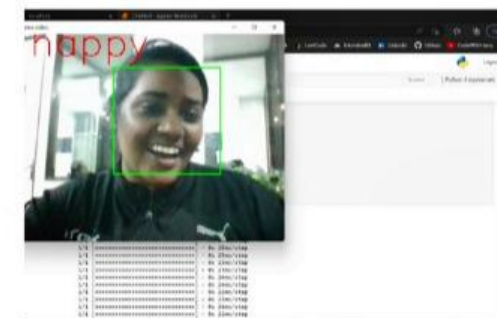

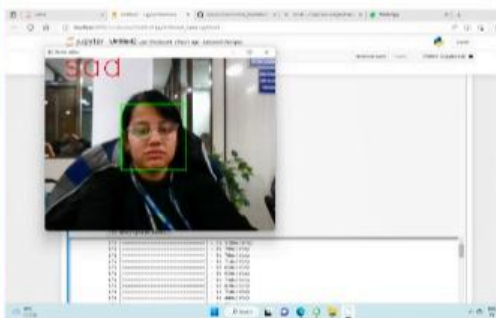

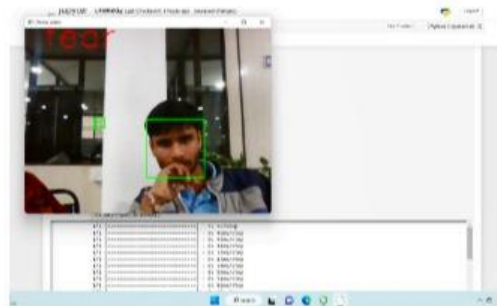

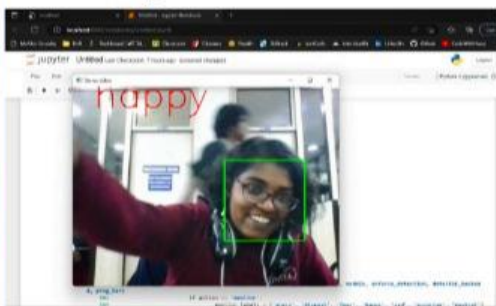

The software takes input from the camera that is, the user's face and detects the emotion on their face and prints the emotion detected on the screen.

With repeated practice we can help the person in identifying emotions and associated them with certain characteristics like :-

- **Happiness** - Slightly closed eyes, wrinkles around eyes, upside mouth.
- **Fear**- Furrowed eyebrows, widen eyes, sweat beads on the face.
- **Suprise** - Eyes widen in shock, mouth open.
- **Sadness**- Downside mouth, avoiding eye contact.
- **Crying**- Tears in the eyes, runny nose.
- **Neutral**- Relaxed features.

Currently our software can identify 6 emotions.
We can't cure the patient's condition as there is no cure for it, but we can certainly try to make their lives better with our app.
